B. WILLIAMS, Seed Merchant and Nurseryman, Upper Hoxton, London, N., has all the best and finest kinds of Seeds, Young Plants, and Rootstocks. Prices on application.
OXONIANS BUT LITTLE LIKELY TO BE EXPLORED BY VISITORS, IS ONE OF THE QUESTIONS WE SHOULD LIKE TO SEE DISCUSSED.

The second is, that Dublin holds out the hand of fellowship. From across St. George's Channel a suggestion is drafted which assuredly meets with favour. The Irish Horticultural Societies and London and Dublin respectively should unite their forces, and hold a grand horticultural meeting in Dublin. The proposal is made in the current number of the Gardener's Record, and the project, if carried out, will be a most praiseworthy one. As the fruit of the combined efforts of the two societies, and especially if there be not harmonious co-operation between the local and the central authorities, the result will be unsatisfactory, and in all probability will be discreditably to all concerned. It is very significant that in the same number of the Record is a report of a meeting held in Dublin for the purpose of considering the propriety of establishing a horticultural club—this proposal, it appears, was received, and is likely to be carried into effect.

We infer from this that the prospects in Dublin of considering the question is most encouraging. It is very significant that in the very same number of the Record is a report of a meeting held in Dublin for the purpose of considering the propriety of establishing a horticultural club. This proposal, it appears, was well received, and is likely to be carried into effect.

A paragraph appeared at p. 993 relating to the fall of a large Beech tree, in ... never heard what was the result of the examination and the supply of fresh oomost, but if there were any sounds superficial rootsof BulMentsize

The following letters appeared in the Standard of the 18th ult. The Effects of the Storm described in the last number of this journal were only mentioned by the correspondent, writing from Fungo, three weeks previously (p. 863). It is not surprising that the effects of such a storm should be more or less serious. There are many flowers, such as M. Cordew, introduced by Messrs. Blackcock, no doubt from Western South America, and afterwards by W. W. Saunders, Esq. (a strumpiturpum), and Director Lindea (sur sulkungia). The potted variety is already spotted with darker spots on the lip.

A very interesting addition to the genus Polycarcin. For a long time we knew it only from the examination of some small specimens, and the effect of the introduction of the flower is very interesting. Having, however, lately had the opportunity of seeing the plant at the Hamburgh show, and of communicating with the introducer, we are able to state that it is a very pretty flower, and that the general effect is much better than we had anticipated. The shape of the sepals is very different, and we are not sure whether it will prove to be the same species as the one we had seen before. The petals are much broader, shorter, and more rounded, and it is very probable that the form an interesting addition to the genus Polycarcin. We are therefore not sorry to have been able to communicate with the introducer, and to learn that he has obtained the flower for the purpose of sending it to Europe.
